

**FOR IMMEDIATE RELEASE**

**DRESSER MASONEILAN<sup>®</sup> COMPLETES TURBINE BYPASS SYSTEM REPLACEMENT  
FOR CRYSTAL RIVER NUCLEAR POWER PLANT**

*Air Operated Turbine Bypass Control Valve and SVI II AP Digital Positioner Round out Solution*

**HOUSTON** (February 24, 2010) – Dresser Masoneilan<sup>®</sup> today announced that it has completed the turbine bypass system replacement for the Crystal River 3 Nuclear Power Plant in Crystal River, Fla.

Crystal River, an 860 MWE pressurized water nuclear reactor in operation since 1977, is undergoing an extended power upgrade that includes a 20 percent power increase and 180 MWE of additional capacity. After a detailed technical comparison and evaluation, Dresser Masoneilan was selected to provide the valves for the turbine bypass system.

“Project engineers wanted a solution that would enhance efficiency and optimize acoustic performance and steam dispersion,” said Chris Bittner, director of engineering for the Flow Technologies segment of Dresser Inc. “Our Dresser Masoneilan 41000 series valve and downstream sparger help disperse steam evenly into the condenser, reducing overall noise and ensuring uninterrupted diversion of steam to the condenser for continued operation of the generator.”

Dresser Masoneilan has a full scope of products and stringent certifications required for the nuclear power industry. The company’s differentiated technologies, such as the SVI II AP digital positioner, form the ideal control valve solution for general service through severe service applications. Dresser Masoneilan is also able to provide customers with technical expertise and support at the local level through its global network of fully equipped aftermarket centers.
